Python Module Index 17
Dictdiffer is a helper module that helps you to diff and patch dictionaries.
Dictdiffer is on PyPI so all you need is:

```
$ pip install dictdiffer
```
Let’s start with an example on how to find the diff between two dictionaries using `diff()` method:

```python
from dictdiffer import diff, patch, swap, revert

first = {
    "title": "hello",
    "fork_count": 20,
    "stargazers": ["/users/20", "/users/30"],
    "settings": {
        "assignees": [100, 101, 201],
    }
}

second = {
    "title": "hellooo",
    "fork_count": 20,
    "stargazers": ["/users/20", "/users/30", "/users/40"],
    "settings": {
        "assignees": [100, 101, 202],
    }
}

result = diff(first, second)

assert list(result) == [
    ('change', ['settings', 'assignees', 2], (201, 202)),
    ('add', 'stargazers', [(2, "/users/40")]),
    ('change', 'title', ('hello', 'hellooo'))
]
```

Now we can apply the diff result with `patch()` method:

```python
result = diff(first, second)
patched = patch(result, first)

assert patched == second
```

Also we can swap the diff result with `swap()` method:

```python
result = diff(first, second)
swapped = swap(result)

assert list(swapped) == [
    ('change', ['settings', 'assignees', 2], (202, 201)),
]```
Let’s revert the last changes:

```python
result = diff(first, second)
reverted = revert(result, patched)
assert reverted == first
```
Dictdiffer is a helper module to diff and patch dictionaries.

**dictdiffer.diff** *(first, second, node=None, ignore=None)*

Compare two dictionary object, and returns a diff result.
Return iterator with differences between two dictionaries.

```python
generate
result = diff({'a': 'b'}, {'a': 'c'})
generate
list(result)
generate
[('change', 'a', ('b', 'c'))]
```

**Parameters**

- **first** – original dictionary or list
- **second** – new dictionary or list
- **node** – key for comparison that can be used in `dot_lookup()`
- **ignore** – list of keys that should not be checked

Changed in version 0.3: Added `ignore` parameter.

**dictdiffer.patch** *(diff_result, destination)*

Patch the diff result to the old dictionary.

**dictdiffer.swap** *(diff_result)*

Swap the diff result.

It uses following mapping:

- `remove` -> `add`
- `add` -> `remove`

In addition, swap the changed values for `change` flag.

```python
generate
swapped = swap([('add', 'a.b.c', ('a', 'b'))])
generate
next(swapped)
generate
('remove', 'a.b.c', ('a', 'b'))
generate

swapped = swap([('change', 'a.b.c', ('a', 'b'))])
generate
next(swapped)
generate
('change', 'a.b.c', ('b', 'a'))
```
**dictdiffer**. `revert(diff_result, destination)`

Call swap function to revert patched dictionary object.

Usage example:

```python
>>> first = {'a': 'b'}
>>> second = {'a': 'c'}
>>> revert(diff(first, second), second)
{'a': 'b'}
```

**dictdiffer**. `dot_lookup(source, lookup, parent=False)`

Allow you to reach dictionary items with string or list lookup.

Recursively find value by lookup key split by '.'.

```python
>>> dot_lookup({'a': {'b': 'hello'}}, 'a.b')
'hello'
```

If parent argument is True, returns the parent node of matched object.

```python
>>> dot_lookup({'a': {'b': 'hello'}}, 'a.b', parent=True)
{'b': 'hello'}
```

If node is empty value, returns the whole dictionary object.

```python
>>> dot_lookup({'a': {'b': 'hello'}}, '')
{'a': {'b': 'hello'}}
```
Changes

Version 0.3.0 (released 2014-11-05):

- Adds ignore argument to `diff` function that allows skipping check on specified keys. (#34 #35)
- Fix for differencing of dict or list subclasses. (#37)
- Better instance checking of differencing objects. (#39)

Version 0.2.0 (released 2014-09-29):

- Fix for empty list instructions. (#30)
- Regression test for empty list instructions.

Version 0.1.0 (released 2014-09-01):

- Fix for list removal issues during patching caused by wrong iteration. (#10)
- Fix for issues with multiple value types for the same key. (#10)
- Fix for issues with strings handled as iterables. (#6)
- Fix for integer keys. (#12)
- Regression test for complex dictionaries. (#4)
- Better testing with Travis CI, tox, pytest, code coverage. (#10)
- Initial release of documentation on ReadTheDocs. (#21 #24)
- Support for Python 3. (#15)

Version 0.0.4 (released 2014-01-04):

- List diff behavior treats lists as lists instead of sets. (#3)
- Differed typed objects are flagged as changed now.
- Swap function refactored.

Version 0.0.3 (released 2013-05-26):

- Initial public release on PyPI.
Bug reports, feature requests, and other contributions are welcome. If you find a demonstrable problem that is caused by the code of this library, please:

1. Search for already reported problems.
2. Check if the issue has been fixed or is still reproducible on the latest master branch.
3. Create an issue with a test case.

If you create a feature branch, you can run the tests to ensure everything is operating correctly:

```
$ ./run-tests.sh
...

Name       Stmts  Miss  Cover  Missing
--------------------------------------
dictdiffer/__init__   88     0  100%
dictdiffer/version   2     0  100%
--------------------------------------
TOTAL          90     0  100%
...

52 passed, 2 skipped in 0.44 seconds
```
